IDE(Integrated Development Environment)

Hi,

We learned about C#, so how do we start programming with C# ?

In todays world, we using programming language IDE's for our projects. For example, Android Studio, Visual Studio, XCode, Eclipse are some of these examples.

An IDE is a software that makes computer programmers job easier.

It brings many useful tools to the developer for the software development phase.

Visual Studio is one of these IDE's and developed by Microsoft. We can do many things with using Visual Studio more faster. For example, programming with C# and C++, mobile applications, web services and more.

I will use Visual Studio in my tutorials. You can use that link for download and take information for Visual Studio : https://visualstudio.microsoft.com/downloads/

After completing the stages, we will ready for our first application.
